○ risk area
↔ wayfinding

01.3 Project Site Wayfinding

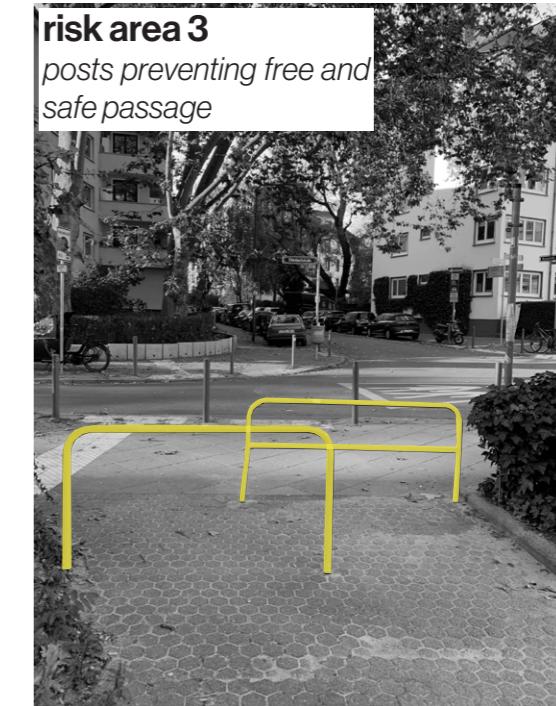

risk area 1, 7
absence of floor indicators before the pedestrian crossing

risk area 2
absence of floor indicators at the entrance to the underground car park

risk area 3
posts preventing free and safe passage

risk areas 4, 5, 6
there are two different floorings indicating crossing but no previous "warning" indicators

Design

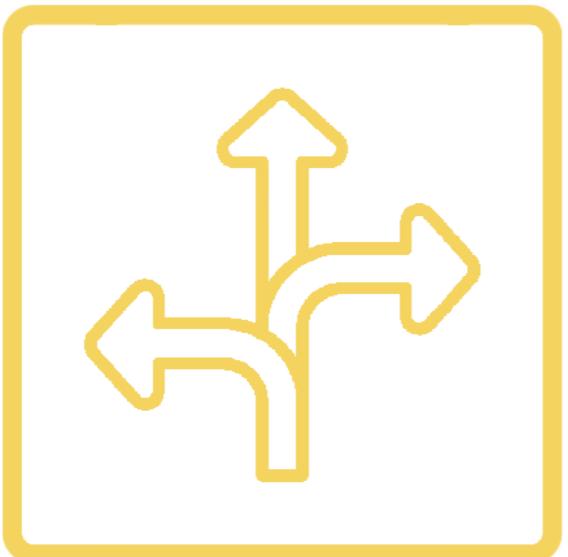

02.1

Design Principles

Designing With The Blind In Mind

Barrier-free architecture means that the world we create ourselves must be designed that it is open to all people, irrespective of their physical condition or age, without the need for assistance and without restrictions.

The goal is to create a people-friendly building, which allows non-stigmatized freedom of access to all.

easily understandable layout

- constant directional changes or even minor deviations from straight lines may lead to the disorientation or distress of visually impaired person,
- doorways to essential services should be off a central circulation area or adjacent corridors,
- corridors and halls should be kept as short as possible

logically grouped functions

- large areas should be broken down into smaller units by varying elements such as light fittings, furniture or floor coverings,
- different colour scheme should be used for different areas,
- essential services, such as toilets, lifts, staircases, should be grouped together

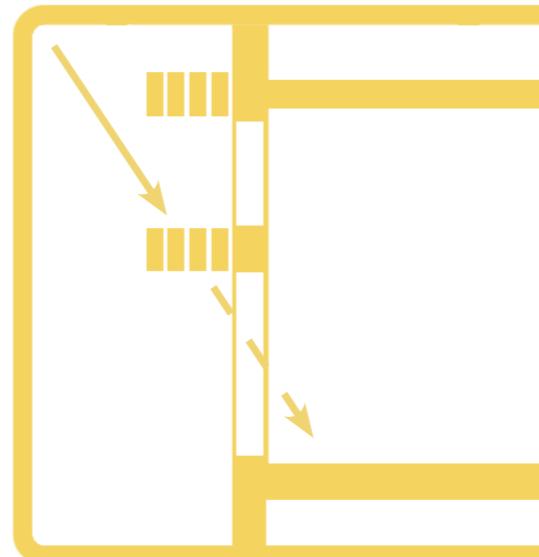

generous circulation spaces

- the most common aid used by people with poor sight to facilitate their mobility is another person's assistance. This form of guidance obviously has implications in terms of door widths, corridor widths and so on,

good colour and tone contrast

- floor covering should **contrasts** with the walls so that the boundary of the floor is clearly visible,
- in very large areas, "walkways" can be created by the use of a floor surfacing with different tactile and colour - **contrasting characteristics**,
- key features of the building have to be visually accentuated

evenly distributed light

- glare should be avoided at all costs,
- light should be **evenly distributed** with no dramatic changes when moving from one area to another,
- where appropriate, the lighting level should be controlled by dimming or switching,
- **avoid: glares, dazzling, optical illusions, heavy shadows**

03 Site plan

Legend

- hard pavement
- wooden deck
- parking
- low/medium greenery
- park
- playground
- info points
- building entrances

03.1 Site Plan Design

03.1

Site Plan

Design

03 Site plan

03.1 Site Plan Design

Engaging all the senses

playground

touch

- incorporating tactile elements for orientation and mobility,
- including interesting items to explore through touch,

sound

- incorporating sound, such as through windchimes, a musical sidewalk, large xylophone, bells, etc.

sight

- using tonal and colour contrasts for better visibility for visually impaired people

sensory garden

touch

- using plants that offer interesting textures for encouraging the sense of touch
- example: lamb's ear for the baby-soft feel, moss for irresistible cool sensation
- note: avoid anything that may be dangerous: roses, agaves

smell

- using highly aromatic plants for creating smell memories
- example: sweet smelling gardenia, honeysuckle, herbs, and spices

sound

- choosing plant flora that make noise when the wind passes through them to stimulate hearing
- example: bamboo stems

sight

- grouping the plants by color for those with only diminished sight,
- incorporating plants with different bloom, leaf, bark, and stem colors provide visual appeal as well

taste

- allow visitors an opportunity to experience garden by using all senses
- example: edible fruit, herbs, and spices

Concept

04.1 Concept the big idea

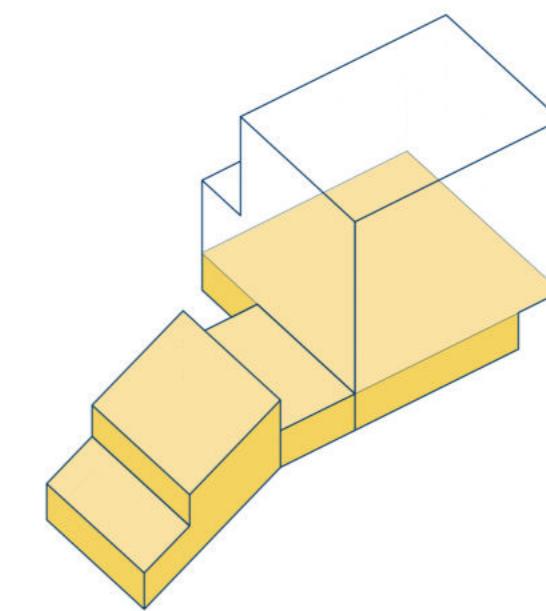

inclusive design principles

design open to all the people, irrespective of their physical condition, age, etc.

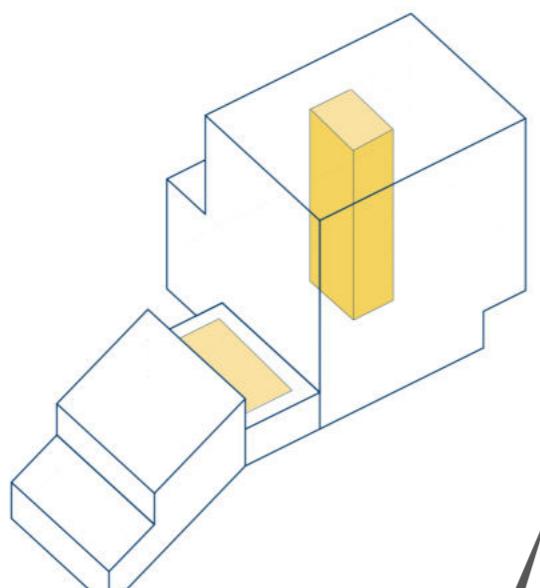

five aboveground storeys

height of the block taken with respect to the neighboring residential buildings

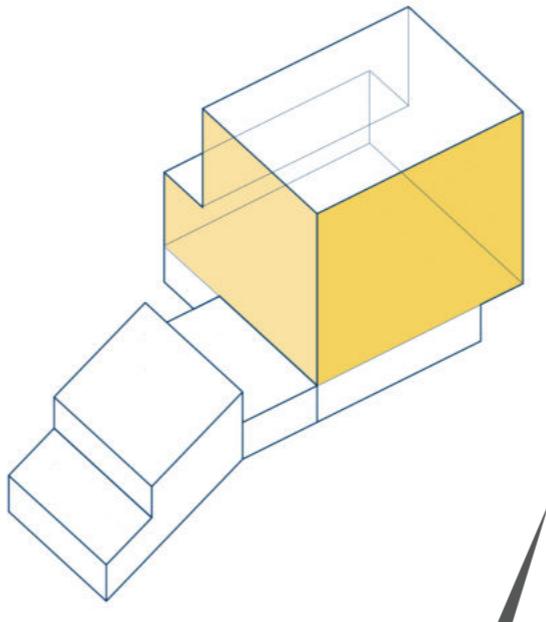

auditorium moved underground

due to its size auditorium with the backstage, lounge, bar and guest cloakroom was moved to the underground storey

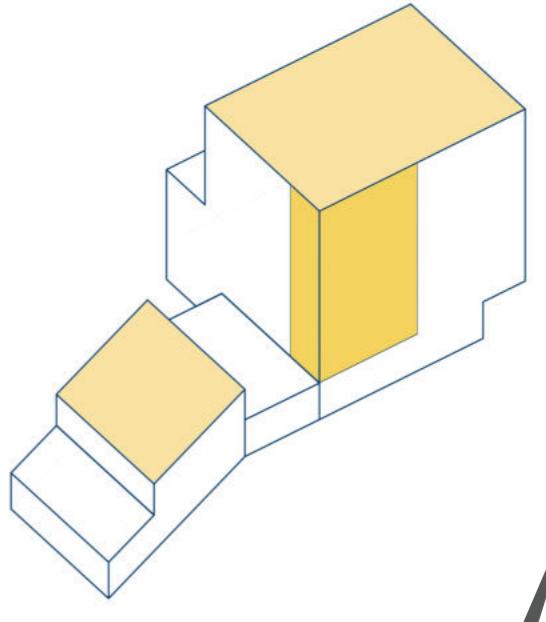

daylight optimization

central atrium and basement skylights for daylight performance optimization

vertical wooden facade panels

vertical wooden facade panels installed on all the facades for privacy, aesthetics and blocking the sun into the building

green roofs and facades

extensive green roofs and ivy planted along the western and southern facades for cooling down the building and capturing noise pollution
